APPENDIX B: CATCHMENT DRAWING

APPENDIX C: OTTHYMO MODELLING

1 Background

Settlers Ridge East Phase 3 (SRE) and Towncentre Place developments (Towncentre) are seeking approval to develop lands immediately west of Towncentre Drive in Belleville. SRE lands are shown in red and the Towncentre lands in blue (see Figure 1-1).

Figure 1-1: Site Location

The stormwater management facilities for Norbelle Creek are already in place. Two major dry ponds provide quantity control for all the lands which drain through Towncentre Drive and Hwy 62. The facilities were reviewed by Jewell in April 2017 and a small expansion was designed to accommodate the SRE Phases 1 and 2 lands. That expansion was constructed concurrently with Phase 1.

The premise of the 2017 work was full development of the contributing lands along with future SWM facilities (ponds 104 and 107). That work showed the stormwater management facilities would meet the design objectives. The subject lands were also included in the 2017 report and no further quantity controls were needed – quality treatment only would be required.

Within the functional servicing report for SRE and Towncentre, Jewell provided the design of the quality treatment.

2 Purpose

The purpose of this design brief is to review the effectiveness of the existing stormwater management facilities under the interim scenario that assumes:

- 1) No ponds 104 and 107 are installed.
- 2) No development will occur beyond the existing urban limit.

2.1 Hwy 62 Target Flows

The Norbelle Creek stormwater management design was initially considered in 1995 by Van Meer Limited in their Nor-Belle Subwatershed Stormwater Management Plan. They determined the existing conditions flows at Hwy 62 were 5.21cms. They completed design scenarios with storage of 1.8ha.m. and proposed a post-development peak flow rate of 3.3cms. They also explained the capacity of the culvert was 3.0cms and that the culvert would require improvements to increase the capacity.

In later years, this 3.3cms post-development peak flow was reduced to 2.8cms (GGG) and carried through to today as the maximum allowable peak flow at Hwy 62. The 2017 report demonstrates that peak flows will not exceed the target of 2.8cms at Hwy 62 and the current review confirms this in the interim conditions.

3 Modelling

The OTTHYMO model prepared in 2017 was adjusted for the interim development conditions. This includes development within the urban area only. The catchment drawing is shown in Appendix B. The urban area is identified as the dashed green line.

The proposed development is within Catchment 108b2. This has been further subdivided into E and W for east and west systems. The SRE and Towncentre catchments were modelled with 60% imperviousness. By contrast, the commercial developments were modelled using 80% imperviousness and the previous residential developments retained their assigned 45% imperviousness from the previous modelling. Catchment 108b1 (north of the pipeline) was also considered to be fully developed with 60% imperviousness. It is within the urban area and flows into Catchment 108b2 but is not the subject of the current application.

The lands within 104 and 107 catchments are undeveloped. The existing wet area for Pond 104 is included within the modelling since it is present and provides natural storage. The Pond 107 is removed.

As a refresher for the reader, Norbelle Creek flows into Cell 2 and then Cell 1 before joining with ditch flows from Towncentre Drive and Hwy 62. The creek then passes through the Hwy 62 culvert. It can be seen from the modelling that the significant work in peak flow reduction is completed by the Cell 2 which reduces peak flows to 2.94cms in the creek. Some catchments will bypass the quantity controls and this has been considered in the modelling. The reader is referred to the line diagram included within Appendix C to understand the flow pathway for each of the catchments. Within the flow diagram, catchments are shown as circles with the catchment number inside. Add points are shown as triangles and reservoirs as squares.

The model results show the peak flow for the interim development condition is **2.69cms**. This is less than what Jewell found in the full development scenario as reported in the 2017 report and is also less than the allowable peak of 2.8cms at Hwy 62. The flow summary is reported in Table 3-1. **The quantity control target is achieved in the interim development conditions.**

The updated OTTHYMO model and flow chart is included in Appendix C.

Table 3-1: 100-Yr Peak Flow Results at Hwy 62

Surface	Target Flow at Hwy 62	Provided	Satisfied
Full (2017)*	2.8m ³ /s	2.73m ³ /s	Yes
Interim (2024)**	2.8m ³ /s	2.69m ³ /s	Yes

* Norbelle Creek 2017 SWM Report, Jewell

** SWM Design Brief 2024, Jewell

4 Conclusion

The Settlers Ridge East Phase 3 and Towncentre Place developments are within Catchment 108b2 and will contribute to the existing stormwater management system for Norbelle Creek. The system is in place and has been designed to receive discharge from the current development. The target flows at Hwy 62 of 2.8cms was demonstrated to be achieved in the 2017 report that considered full development scenario.

This design brief was issued to understand the performance of the Norbelle Creek stormwater management system during the interim development conditions, which considers only development within the urban area but excludes the lands within Catchments 104 and 107.

The Norbelle Creek SWM facilities are on-line facilities and therefore perform only quantity controls. Quality controls must therefore be off-line. The Norbelle Creek plan is for quality treatment to be provided through measures such as OGS units. These have been designed for the two developments and were reported in the functional servicing study issued under separate cover.

Hydrologic modelling was carried out for the interim development conditions and Jewell found that the peak flows at Hwy 62 will be 2.69m³/s, which is less than the allowable discharge of 2.8m³/s. The quantity targets are satisfied.

The Norbelle Creek stormwater management will continue to function within the design targets in the interim development conditions.

*           Developments
*
*           NBELLE model is conversion of Settlers SWMHYMO model and
*           represents fully developed conditions with the expanded
*           pond on Barkema Lands - Note: the full Settlers pond did
*           not get constructed.
*
*           NBELLEV1 model is altered to determine how much storage
*           in Cell 2 is required solely due to spill containment.
*
*           NBELLEV2 model is altered to allow full development of

```

* catchments 110, 106a, 106b, and 108b1.
 * The Settlers pond is enlarged with the addition of
 * 0.4ha*m storage on Barkema lands.
 *
 * NBELLEV3 model considers how basins 104 and 107 will be
 * developed. 104 will have reduced outflow at Sidney St.
 * 107 will have a combined quantity/quality pond.
 *
 * NBELLEV5 was developed to consider the expansion of Cell 2
 * eastward (north of Cell 1). The purpose of this model is
 * to check to see if the 100YR WSEL of Pond 2 can be lowered
 * from 109.45m closer to 109m. This would help to improve
 * the flow capacity in the channel.
 *
 * NBELLEV6 places pond 107 north of pipeline near Sidney st.
 * Catchments are adjusted. Uses the expanded Cell 2 per V5
 * 108b is now directed into Cell 2. 108d becomes Cell 1.
 *
 * NBELLEV7 Catchment 108b is routed to Cell 1
 *
 * NBELLEV8 Combining Cell 1 & 2 into Master Cell 2. Includes
 * North expansion into Barkema. Area for Cell 1 is reduced to
 * allow for bypass channel. Rough area calculation. STORAGE
 * DISCHARGE TABLE EXCEEDED.
 *
 * NBELLEV9 Add Pond 110. Catchment 110 area split into
 * 110a,b,c,d,e. Master Cell used for Nor-Belle Pond.
 *
 * NBELLEV10 Reviews impact of Phase 3 of SRE and Towncentre
 * Drive developments. The model considers no development
 * outside of the urban area.

length solved from $A=1.5(L)^2$

 * 100 Year Storm
 *
 * Post-Development Flow
