The City of Belleville has initiated a Municipal Class Environmental Assessment to evaluate alternative approaches for the replacement of the Bronk Road bridge, located 0.2 km north of Thrasher Road on Bronk Road. The bridge is a single lane, single span over Parks Creek constructed with cast in place concrete T-beams in 1930. The latest study indicated rehabilitation within the next 1 to 5 years and replacement within the next 6 to 10 years. Due to its condition and age, the City is considering the options available, including replacing the structure.

The study will proceed in accordance with the Municipal Class Environmental Assessment, October 2000, as amended in 2007 - Schedule ‘B’. Various structure alternatives for the bridge replacement will be analyzed and evaluated based on feasible engineering technologies, public safety, and natural, social, economic and cultural environments.

Public input during the study is encouraged. A Public Information Centre (PIC) will be scheduled during the study to provide additional information, answer questions regarding the project, identify the alternative structures being evaluated, and solicit feedback and comments. Upon completion of the study, a Project File Report will be made available for public review and comment.

If you have any comments or questions or require any further information about the study or the Municipal Class Environmental Assessment process, please direct them to either of the persons listed below.
